FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

VOL. LII. AUGUST 1947. No. 8.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Summer arrived about six weeks late. The cool weather of the previous months offered no preparation for August's heat and humidity. This was the warmest August since 1900 and the second warmest in 60 years of record. It was the hottest month since July 1935; quite a contrast to August of last year, which was the second coolest of record.

Normally, August is two degrees cooler than July. This year it was four degrees warmer. Extreme temperatures were generally higher than at any previous time this year, and there were more days with 90° or above than in the three previous months together. Except for a cool spell during the first few days, during which the monthly minima were recorded, practically every day showed a temperature excess. The warmest part was in the middle of the month. Nights as well as days were hot and uncomfortable, as unusually high relative humidity accompanied the high temperatures. Sunshine was below normal, owing mostly to convective cloudiness caused by local heating.

Thermally induced thunderstorms occurred somewhere in the State on all but three days, and were reported most generally on the 9th, 26th, and 30th. Periods of precipitation were fairly evenly spaced, but amounts were spotty. At Philadelphia, the Weather Bureau City Office recorded almost double that of the Airport Station about seven miles away.

Thunderstorms were responsible for four deaths and minor property damage. At Carlisle on the 9th, the Carlisle Hospital was darkened for three hours after lightning had struck a transformer. Doctors and nurses worked by candlelight. On the 12th at Pennsburg, two baseball players died shortly after being struck by lightning during a ball game. Five others were felled momentarily by the bolt. At Oil City a swimmer was killed by lightning on the 20th. On the 26th a nine year old boy was killed by lightning at Bedford, while on the same day another nine year child survived being struck on the arm by lightning. Its arm was temporarily lamed. At Harrisburg on the 31st, a man suffered first degree burns from electric shock while using the telephone during a thunderstorm. Property damage during the various storms was mostly owing to fires set by lightning.

Although there were no floods on the main rivers, two steam railroads serving the Wyoming Valley were knocked out of commission by landslides and swollen waters as a result of heavy rains during a thunderstorm at Wilkes-Barre on the 17th. Street car service on the Nanticoke line was suspended for about a week. Plymouth trolley car service was curtailed because of roaring waters which came from the hill sections and covered Main Street. Trackless trolley lines at Sugar Notch and the substation at Ashley were hit by lightning, but service was not interrupted. A stone arch bridge over Black Creek, near Nanticoke city limits was washed out.

The warm August counterbalanced the cool June and July weather, and brought the three summer months to near normal. Precipitation for the period was above normal.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 81 stations was 74.0°, which is 3.7° above the 60-year normal for August. The highest monthly mean was 80.3° at Farrell and the lowest was 67.8° at Wallenpaupack Dam. Extremes ranged from a maximum of 100° at Farrell on the 12th and 13th, to a minimum of 37° at Mount Pocono and Wallenpaupack Dam on the 2d.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 209 stations, was 3.85 inches, which is 0.30 inch below the 60-year normal for August. The greatest monthly amount was 11.46 inches at Farrell, while the least was 0.87 inch at Holtwood. The greatest amount recorded in any 24 consecutive hours was 3.66 inches at Farrell on the 14th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).

a, b, c, etc. Number of days missing, for example, b indicates two days missing.

Italics, data interpolated.

§ Partly interpolated.

§§ Incomplete.

† And other dates.

†† Daily amounts inconsistent.

‡ Received too late to be included in means and summaries.

• Included in next measurement.

// Windshield on gage.

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.
8 Data recorded at Altoona-Blair County Airport.
9 Official Station designation is Allentown-Bethlehem Airport.

REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The hot summer weather that was August's chief characteristic continued up to the 15th of this month. From then on there was a decided change to colder, and the remainder of the month was as cold proportionately as the first part was hot. As a result of the balance between these two extremes, the mean temperature was exactly normal, pointing up the fact that a "normal" month may not have normal temperature distribution, and may be, as this was, a combination of some uncomfortably warm as well as uncomfortably cold weather. That there must have been something more than normal fuel consumption, however, may be deduced from the number of degree days (based on a mean temperature of 65°), at some localities ranging to three times the normal.

Rainfall was below normal but occurred with sufficient frequency to prevent excessive dryness. The first week was rather rainy owing mostly to shower and thunderstorm activity caused by a frontal passage. Again on the 15th there were general thunderstorms and heavy rains induced by an extensive front behind which ranged the cold weather that continued until the very last. The rains that followed in the next week were cold frontal and were accompanied by much windiness on the 21st and 22d.

A tornado that wrought the most damage near Burgettstown began about 2:00 a. m. at Eldersville with heavy thunder and lightning, but with little rain. The total path was 10 miles long and about a hundred yards wide. Two people were killed and about 20 houses and barns were damaged, the total property loss being about $100,000. In its path from Eldersville to Racoon, 17 houses were wrecked, at least five being completely destroyed. The roof of one house was found about a mile away and boards were found four miles away. The damage was worst at South Burgettstown. The most spectacular damage at that place was that of a machine shop constructed of brick, which suffered $15,000 damage. A lumber yard also suffered considerable damage. Public utilities were disrupted and among other damage, corn fields and orchards were laid waste.

The killing frost on the 23d ended what was probably the shortest growing season of record: 138 days. Nearly all late corn was killed by frost, while the buckwheat crop was damaged in the northern parts of the State. The lowest temperature recorded, 17° at Hawley on the 23d, was the lowest of record for September. In contrast to the shortness of the growing season this year was that of last year, which was the longest of record.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 64.2°, which is the 60-year normal for September. The highest monthly mean was 71.6° at Marcus Hook and the lowest was 58.0° at Hawley, 1 S. Extremes ranged from a maximum of 95° at Phoenixville on the 20th to a minimum of 17° at Hawley, 1 S. (Wallenpaupack Dam) on the 28th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 216 stations, was 2.35 inches, which is 1.08 inches below the 60-year normal for September. The greatest monthly amount was 5.21 inches at Graterford, while the least was 0.24 inch at Huntingdon. The greatest amount recorded in any 24 consecutive hours was 2.53 inches at Coudersport, 7.5 E. on the 2d. A trace of snow fell on the 22d and 30th at scattered stations.

OBITUARY

Mr. Bryson Greenawalt, who served as Cooperative Observer at McConnellstown since October 1, 1944, died on July 10, 1947.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).

[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.

Italics, data interpolated.

§ Partly interpolated.

§§ Incomplete.

† And other dates.

†† Daily amounts inconsistent.

‡ Received too late to be included in means and summaries.

* Included in next measurement.

// Windshield on gage.

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

HARRISBURG, PA.

VOL. LII. OCTOBER 1947. No. 10.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The month was warm, dry, sunny and pleasant. It shared honors, in fact, with that of 1900 as the warmest October of record It was also the sixth driest, and, with an average of only 0.18 inch for the first 27 days, gave promise of being the driest. The dry spell, which had begun on the 23d of September, assumed the proportions of a near drought, in which conditions were said to have been worse than in October 1924, when 0.28 inch was averaged over the State. Aside from pastures shriveling and streams drying up, a cause for alarm had been the fire hazard in the forests. Many small blazes threatened, but were quickly brought under control. The Governor closed the State forests on the 26th. However, the passage of a cold front on the 28th brought more than an inch of rain in the following days. The hunting season opened as planned, much to the relief of hunters.

The drought was more severely felt in some places than in others. At Harrisburg there were 35 days without measurable rain (beginning in the last week of September). Except for a few localities at which a few hundreths of an inch fell, no measurable rain was observed for the first 12 days. Before the end of the dry spell, springs and wells had dried up and farmers had to haul water for their cattle. Pastures were burned, making the use of ensilage and purchased feed neccesary. The ground was too dry and hard for plowing and seeding, which were consequently delayed until the end of the month.

Skies were generally clear, and sunshine was as much as 50% above normal. The daytime temperatures were quite high, maxima in the 80's being common, and in a few places in the low 90's. The first few days, however, were cold, in continuation of the cold spell of the latter half of September. In some places new low records were set. At Harrisburg on the 1st, and at Pittsburgh on the 2d, the previous records for the respective days were broken. After the cold spell had run its course, warm weather was prevalent, and the second decade especially was very warm. At Harrisburg, new maximum records were set on the 21st, 22d and 23d. The maximum of 86° on the 23d was the warmest for so late in the season. At Philadelphia, high temperature records were broken on the 20th, 21st, 23d and 27th, with the maximum on the 21st the warmest for so late in the season. At Pittsburgh, prior records were tied on the 22d and 26th, while new records were set on the 23d and 27th.

There was no snowfall anywhere in the State, an occurrence that has happened only six times previously in the last 60 years. The last time that this occurred was in 1924. The normal snowfall is 0.2 inch.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 58.6°, which is 5.9 above the 60-year normal for October. The highest monthly mean was 66.6° at Phoenixville and the lowest was 52.4° at Kane. Extremes ranged from a maximum of 93° at Marcus Hook on the 21st to a minimum of 17° at Somerset on the 1st.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 216 stations, was 1.34 inches, which is 1.90 inches below the 60-year normal for October. The greatest monthly amount was 4.01 inches at Mount Pocono, while the least was 0.38 inch at Corry. The greatest amount recorded in any 24 consecutive hours was 3.01 inches at Philadelphia, Shawmont on the 28-29th. A trace of snow fell, which is a departure of −0.2 inch.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
•, [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
• Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

In contrast to the pleasant weather of October, this month was unpleasantly cold and wet. This was the coldest November since 1933, and the eighth coldest and tenth wettest of record. Ordinarily the drop in temperature between October and November is about eleven degrees. This year it was a full twenty degrees. Precipitation was more than three times that of the previous month. Snowfall was slightly above normal and was concentrated generally in the last week, but distribution was spotty. The area around Erie had heavy falls of snow. Windiness was in considerable evidence, especially around the 24th and 25th. Sunshine and cloudiness were about normal.

The first decade was the warmest in most localities, showing an excess above the normal, especially in the southeast. The highest temperatures were recorded in this period, most stations observing maxima in the 60's on at least one day. After the first decade, temperatures became progressively lower, and the lowest minima occurred at the close, with temperatures below 20° not uncommon.

Precipitation occurred most generally in the first half, but in some sections the amounts were evenly spaced through the month, with snow quite common in the last week. Erie had a total of 35 inches, a November record, the previous record being 19 inches. Twenty inches fell in one storm on the 25-26th, the greatest of record for a single storm at Erie for any month except December. Greater amounts were reported in other places in the vicinity of Erie. Main streets and highways were kept open, a remarkable achievement in view of the heavy fall and drifting; but Port Erie Airport was closed from the 26th to the end of the month, due to the inability to clear the runways. The heavy snowfall was confined to an area within a 75 mile radius of Erie, and was probably due to instability as the cold air moved over the warm Lake waters. A single flash of lightning that occurred during a snow shower on the 25th gave evidence of the turbulence in the vicinity.

Windiness was rather high and windy periods evenly distributed over the entire period. At Uniontown a destructive wind on the 15th, following an occluded frontal passage, caused damage to roofs, telegraph and telephone lines, and glass windows, particularly in the business district. Some high winds occurred also with another occlusion on the 24th and 25th, following the lowest barometric pressure of the month.

In spite of the cold of November, the autumn season turned out to be about one degree above normal, and the heavy rainfall could not counteract the deficiency which had accumulated in September and October. The seasonal deficiency was 1.66 inches.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 81 stations was 38.3°, which is 3.0° below the 60-year normal for November. The highest monthly mean was 46.6° at Marcus Hook and the lowest was 32.8° at Curwensville. Extremes ranged from a maximum of 71° at Marcus Hook on the 5th to a minimum of 0° at Philipsburg on the 30th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 220 stations, was 4.22 inches, which is 1.32 inches above the 60-year normal for November. The greatest monthly amount was 9.02 inches at West Chester, while the least was 1.90 inches at Covington. The greatest amount recorded in any 24 consecutive hours was 4.62 inches at West Chester on the 3d-4th.

The average snowfall for the State was 3.5 inches, which is 0.8 inch above the 60-year normal. The greatest monthly snowfall was 35.1 inches at Erie. The greatest fall for any observational day was 15.2 inches at Erie on the 25-26th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, b indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.
8 Data recorded at Altoona-Blair County Airport.
9 Official Station designation is Allentown-Bethlehem Airport.

L. F. CONOVER

HARRISBURG, PA

VOL. LII. DECEMBER 1947. NO. 12.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Although temperatures were below normal, December was not an unpleasant month, owing mostly to dryness and sunshine. Precipitation was only about half of the normal, but was rather evenly spaced, and snowfall was not general until the last decade. The temperature deficiency was under two degrees, continuing a cold trend for December which has appeared, with one exception, since 1941. Windiness was much in evidence about the 16th and generally in the last week. The excess of sunshine occurred in spite of normal cloudiness.

There were four main periods of precipitation. The first storm, around the 6th, was a result of cold frontal action extending from a depression that moved from the Lakes Region to New England in two days, bringing moderately heavy rain. About the 11th, there was some light precipitation in connection with a Gulf storm which developed along the Atlantic Coast and brought snow in the cold air north of its warm front. The heaviest rains of the month, besides considerable wind, came as a result of a low pressure area which moved rapidly northeastward from the Gulf of Mexico and passed over Pennsylvania on the 16th. In this depression was a complicated system of fronts and occlusions which made for a considerable amount of convergence. Since temperatures were generally above freezing, the precipitation was in the form of rain. Another storm occurred about the 24th in consequence of an occlusion which developed off the Atlantic coast. Precipitation was light and was in the form of snow. The storm of the 26th and 27th, which brought the unusually heavy snowfall to New York City, rivaling the Blizzard of 1888 as a topic of conversation, was a similar coastal storm that hovered along the Atlantic coast, moving slowly northward from Hatteras to Nantucket. Although it brought general snowfall, amounts were not excessive as they were in New York City. Had this snow come one day earlier, the State would have had a White Christmas. As a rule, driving conditions were comfortable nearly everywhere during the month, but a number of days with freezing rain caused accidents, notably on the 5th, 15th, and 30th.

Temperatures during the first decade were above normal, and maxima in the 50's and 60's were not uncommon, but no new records were set. From the 9th to the close, mean daily temperatures were low, except for a few days. The Atlantic section was somewhat warmer than the Ohio, but few stations showed a monthly excess.

High winds were the rule on the 16th. The greatest damage reported was at Wilkes-Barre, where gusts were estimated at 70 miles per hour. The high wind shattered windows in a score of stores, destroying also holiday decorations recently erected. Electric power interruptions affected hundreds of customers, most of them in the South Wilkes-Barre section. The emergency power plant at Mercy Hospital had to be turned on when its regular power failed. Happily, no operations were in progress at the time.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 29.6°, which is 1.6° below the 60-year normal for December. The highest monthly mean was 36.2° at Marcus Hook and the lowest was 24.0° at Montrose. Extremes ranged from a maximum of 66° at Phoenixville on the 2d to a minimum of −5° at Kane and Bradford on the 30th.

PRECIPITATION

The average precipitation for the State, as deduced from the observations at 197 stations, was 1.52 inches, which is 1.53 inches below the 60-year normal for December. The greatest monthly amount was 3.51 inches at Kregar, while the least was 0.59 inch at Burnt Cabins. The greatest amount recorded in any 24 consecutive hours was 1.25 inches at Stroudsburg on the 15-16th.

The average snowfall for the State was 6.3 inches, which is 1.7 inches below the 60-year normal. The greatest monthly snowfall was 24.7 inches at Corry. The greatest fall for any observational day was 12.0 inches at George School on the 26th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
ª, ᵇ, ᶜ, etc. Number of days missing, for example, ᵇ indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

VOL. LII. ANNUAL SUMMARY 1947. No. 13.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Although 1947 showed but slight deficiencies in temperature and precipitation, it was a year of contrasts. January was warm, but February and March were cold with considerable snow. April was pleasant, but May was cool and wet. June and July were comfortable, having been cool; August was almost unbearably hot. Even the normality of September was deceptive; the first half hot, the latter half cold. A fine warm October was followed by a cold wet November. December, although cold, was sunny. Snowfall was above normal, the excess established in February and March more than counterbalancing the deficiencies of the other months. The growing season was generally one of the shortest, in considerable contrast to last year's. Frosts and freezes occurred in early May and again in late September, causing much damage. Tornadoes occurred on five days—in May, June and September.

WEATHER BY MONTHS

JANUARY: The New Year got off to a bad start, New Year's day being particularly unpleasant, with sleet, glaze, snow and generally hazardous driving conditions resulting in numerous accidents. However, in a few days it soon warmed up and the month turned out to be the warmest January in ten years and the sixth warmest of record. Temperatures in the 60's and even the 70's were general in the last week.

FEBRUARY: The warmth of the previous month did not carry over into February. Winter had finally arrived. This was the coldest February in 11 years, the snowiest in 21 years, and the most unpleasant month of the year; in fact, the most unpleasant since January, 1945. Snowfall caused much hardship, resulting in traffic tie-ups, accidents, loss of business, and other effects. Twenty-one persons were said to have died as a result of the heavy snowstorm of the 20th, eighteen at Philadelphia alone.

MARCH: Coming in like the proverbial lion, it acted accordingly all month, except for a few lamb-like days in the middle of the month. The March lion roared at times, wind being the greatest culprit. The most violent storms occurred from the 23d to the 26th, including thunderstorms, a drop in temperature of the order of 30 degrees in 24 hours, and winds of 60 to 70 miles per hour in some places, with considerable damage. This was probably the most widespread and violent of recent years. The lion became lamb-like on the last day. An unusual feature was the absence of any temperatures as high as 70°.

APRIL: After two months of unpleasant weather, April was a welcome relief, with relatively high daytime temperatures bringing the mean above normal. There was considerable windiness, but this occurred generally on warm days. Precipitation was frequent and copious. The heaviest rains in many places came on April 5, which resulted in flooding at Towanda and Wilkes-Barre, and in some low portions of the city of Wellsboro, Lackawanna Valley cities and towns, and several smaller communities. Total damage was estimated at a million dollars. Thousands of people had to spend Easter away from their homes, as they were evacuated to avoid flood dangers. Easter was notable also for the highest wind velocities, sometimes 60 to 80 m. p. h., and some of the highest temperatures. Electrical phenomena of a peculiar nature were observed by many people near Cashtown, Adams County, on the 2d. Fire balls floated inside and out of houses from 10:15 p. m. to 10:30 p. m. causing damage to the houses and in some cases shattering trees and tearing great holes in the rocky mountainside.

MAY: The fourth wettest May of record transformed the accumulated rainfall deficiency of the first four months into an excess. Temperatures were below normal, and there was a cold spell from the 7th to 10th inclusive, during which freezes occurred. Much damage was done to cherry, apple and peach trees, as in many cases the temperatures were too low to be raised much by smudgepots. An area of less than 25 miles diameter in Schuylkill and Berks Counties suffered visitations of tornadoes on three days. On the 21st at Shoemakersville, a tornado killed a 13-year-old boy, when it destroyed a garage in which he had taken shelter. On the 25th a small tornado struck in the vicinity of Hamburg and Lenhartsville, damaging buildings. On the 29th a tornado at Pine Grove resulted in the death of a farmer and two horses as it demolished a barn. At Carlisle on the same day a tornado damaged scores of buildings along a 15 mile path.

JUNE: Despite some uncomfortably warm days, this was the coolest June in 19 years. There were no frost occurrences, but a few places reported minima of 32° or below. A tornado of great intensity occurred on the 8th. It entered the State from Ohio, and caused three deaths and more than a million dollars of property damage in its passage across Mercer County. The towns of Sharon, Mercer and Grove City were chiefly affected, but it was at Sharon that the greatest toll was taken. In addition to the three fatalities more than 300 persons were injured, 51 of them requiring hospitalization. 325 houses were damaged. In view of the high property loss, the death toll was considered light.

JULY: This month tied the July, 1920 record as the coolest in 53 years. It was also the wettest in 51 years. Although there were no floods on the main rivers, considerable distress and much property damage resulted through local flooding brought on by some exceptionally heavy rainfall, particularly at Erie, where 10.41 inches was officially measured by the recording raingage. Unofficial measurements at Erie by Weather Bureau investigators disclosed that at least 20 inches fell in 24 hours in parts of Erie. Low parts of Erie were flooded, causing damage conservatively estimated at $250,000. There were no casualties, but 66 persons were evacuated from flooded areas by the Coast Guard and Red Cross, assisted by the Police and Fire Departments.

AUGUST: In contrast to the cool July, this was the hottest month since July, 1935, the hottest August in 47 years, and the second hottest of record. Nights as well as days were uncomfortable, as unusually high relative humidity accompanied the high temperatures. Lightning was responsible for four deaths. On the 12th at Pennsburg, two baseball players died shortly after being struck by lightning during a ball game. Five others were felled momentarily by the bolt. At Oil City

GENERAL SUMMARY (Continued)

a swimmer was killed by lightning on the 20th. On the 26th a nine-year-old boy was killed by lightning at Bedford.

SEPTEMBER: Hot summer weather continued up to the 15th. From then on was a decided change to colder, and the remainder was as cool as the first part was warm, resulting in a "normal" mean temperature. A tornado on the 2d near Burgettstown resulted in the deaths of two people and property damage of about $100,000. A killing frost on the 23d ended the growing season, killing corn and buckwheat.

OCTOBER: Warm, dry, sunny and pleasant, this equalled October, 1900 as the warmest of record. It was also the sixth driest and for the first 27 days gave promise of being the driest. Near-drought conditions prevailed, with pastures shriveling and streams drying up. The Governor closed the State forests on the 26th, owing to the fire hazard, but rescinded the ban after the heavy rains at the end of the month.

NOVEMBER: After October's warmth and dryness, November was an unpleasant change, being a full 20° colder than the former, as well as more than three times as wet. Windiness was in considerable evidence, especially around the 24th and 25th. Snowfall was slightly above normal and was concentrated generally in the last week, but with spotty distribution. Erie had a total of 35 inches, a November record.

DECEMBER: Though colder than normal, this was not an unpleasant month, owing mostly to dryness and sunshine. Precipitation was about half normal. Snowfall was not general until the last decade, but the heaviest snow came just one day too late to provide a white Christmas.

VOL. LIII. JANUARY 1948. No. 1.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

This was the coldest January since 1940 and the sixth coldest and fifth snowiest of record. It was 14 degrees per day colder than January of last year, which was the sixth warmest of record. Temperatures in the first decade were not far from normal, but the following period was cold, particularly in the last half, when a considerable number of days with minima below zero were recorded, in some cases establishing new low records. The cold aggravated a bad fuel shortage, and in many localities the use of gas for industrial purposes had to be cut off. Fuel oil was also in very short supply.

Precipitation was very frequent, though slightly below normal, but snowfall was about double the normal, owing to the cold. There was very little precipitation after the 25th. A great part was on New Year's Day, in the form of rain, sleet and freezing rain, making that day quite unpleasant. From most parts of the State, especially the Eastern portion, came reports of glaze on the 1st and 2d (said in some cases to be the worst of memory), causing slippery roads that resulted in many traffic accidents. The glaze heavily coated utility and power lines, resulting in breaks in service. There were also thunderstorms reported on the 1st from 12 stations. High winds on a number of days added to the variety of the weather.

The storm of January 1–2, which caused the heaviest precipitation of the month and in some places accounted for the major part of the month's total, was an intense depression with several waves. This moved from Oklahoma to Pennsylvania in 24 hours, and extended, with its fronts and waves, from the Gulf to the Massachusetts coast. The warm moist maritime tropical air was lifted over the polar continental air, causing generally heavy precipitation, including freezing rain in the cold air north of the associated warm front, and snow west of the cold front. The storm of the 13th was mostly an elongated trough that extended throughout the Atlantic coast states, with a complicated frontal structure in extension of a depression that was then located in Ontario and Quebec. The snowstorm of the 24th, which produced in most cases the heaviest snowfall of the month, was a coast storm which moved rapidly along the Atlantic coast, while being held off the coast by a high pressure area in the New England States and Canadian Maritime provinces. Sixteen stations reported amounts of 12 inches or more in 24 hours during this storm.

Strangely enough, in spite of the frequency of precipitation, sunshine was generally above normal.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 92 stations was 20.1°, which is 8.1° below the 61-year normal for January. The highest monthly mean was 28.6 at Marcus Hook and the lowest was 12.8° at Kane. Extremes ranged from a maximum 57° at Waynesburg on the 1st to a minimum −31° at Kane on the 31st.

PRECIPITATION

The average precipitation for the State, as deduced from the observations at 208 stations, was 3.02 inches, which is 0.11 inch below the 61-year normal for January. The greatest monthly amount was 5.74 inches at New Park, while the least was 1.36 inches at Jamestown. The greatest amount recorded in any 24 consecutive hours was 2.70 inches at West Grove on the 1-2d.

The average snowfall for the State was 21.5 inches, which is 10.9 inches above the 61-year normal. The greatest monthly snowfall was 40.5 inches at Kane. The greatest fall for any observational day was 17.5 inches at Kane on the 24-25th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T. Trace (0.005 inch or less).

a, b, c, etc. Number of days missing, for example, b indicates two days missing.

Italics, data interpolated.

§ Partly interpolated.

§§ Incomplete.

† And other dates.

†† Daily amounts inconsistent.

‡ Received too late to be included in means and summaries.

* Included in next measurement.

// Windshield on gage.

/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

VOL. LIII. FEBRUARY 1948. No. 2.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Normal temperatures, a surplus of sunshine, and a deficiency in precipitation were the keynotes to February's weather. The Western or Ohio section was warmer and wetter than the Atlantic division, but the latter had more snow. Snowfall was about normal, but snow cover was generally gone as the month closed. High winds were not uncommon, and were associated most generally with the stormy periods that resulted in precipitation.

In an extension of January's cold weather, the first eleven days were considerably below normal in temperature. From about the 12th, however, rapid warming took place, which resulted in the thawing of most of the snow cover and rotting of ice in the rivers. During this warm spell of about ten days the deficiency of the previous period was obliterated. Ice generally moved out of the rivers without untoward incident about the 15th to 17th, much to the relief of residents living under threat of flooding. There were only a few ice jams, but no serious flooding occurred. The remaining days were about evenly divided into short cold and warm spells of a few days each.

Precipitation occurred in four main periods, about the 4th, 13th, 22d, and 28th. The first storm, which accounted for much of the snowfall, was caused by wave action in a front extending eastward from a depression central in New Mexico. In the stormy period of the 13th, heavy precipitation, both rain and snow, accompanied an outstanding depression that developed over Louisiana on the 12th and moved rapidly northeastward on the 13th, with a great increase in intensity. An extensive occlusion from this low pressure area, acting as a cold front, reached all the way from Louisiana to Lake Erie. Considerable glazing occurred during this storm, resulting in traffic accidents. The precipitation of the 22d occurred in connection with wave action off the south Atlantic coast. But the most notable storm was that of the 28th, a deep depression which moved from Oklahoma to Iowa in 24 hours and had a number of fronts with a variety of associated weather, including heavy rain, high winds, and a considerable range of temperature.

The past winter season of December, January and February ended with a precipitation deficiency of 2.43 inches and a temperature deficiency of 3.4°. It was the driest winter in two years and the coldest in three. The total precipitation for the winter was 6.61 inches. The mean temperature was 26.0°.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 83 stations was 28.3°, which is the 61-year normal for February. The highest monthly mean was 37.0° at Uniontown and the lowest was 19.9° at Montrose. Extremes ranged from a maximum of 75° at Phoenixville on the 20th to a minimum of −25° at Lawrenceville, Wellsboro, and Ridgway on the 1st and Kane on the 9th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 210 stations, was 2.07 inches, which is 0.79 inch below the 61-year normal for February (adjustment made for leap year). The greatest monthly amount was 3.98 inches at Kregar, while the least was 0.62 inch at Covington. The greatest amount recorded in any 24 consecutive hours was 2.00 inches at Punxsutawney on the 13th.

The average snowfall for the State was 10.8 inches, which is the 61-year normal. The greatest monthly snowfall was 21.5 inches at Springs. The greatest fall for any observational day was 10.5 inches at Allentown on the 22d.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
▪ Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning: the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

HARRISBURG, PA.

VOL. LIII. MARCH 1948. No. 3.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

The temperature averaged well below normal for the first two weeks of March, then suddenly spring came about a week ahead of schedule. About the 14th, the temperature rose above normal, and the remaining half of the month, with few exceptions, was fairly mild for March. The premature warm spell reached a climax on the 21st, Palm Sunday. However, Easter, on the 28th, was marred by cold, blustery weather, with light snow in nearly all sections.

Precipitation was 6% more than normal, and very evenly distributed throughout the month. In fact, rain was so general during the last half of the month that little soil preparation was accomplished on farms or in gardens. Snowfall was only 65% of normal, and was all confined to the first 12 days of the month, except for light snow over practically all sections on the 28th. This did not remain on the ground, but melted mostly as it fell. Snow cover was nonexistent after the 14th, except for patches at some high elevations.

The principal storm damage reported was caused by a tornado which struck Mt. Pleasant community in Westmoreland County, about 7:30 p.m. on the 19th. Three children sustained minor injuries, due mostly to flying glass; more than a dozen houses were reported damaged. The Ralph Ferrell Concrete Block factory and the I. F. Koontz Concrete factory were wrecked. Utility lines were blown down. Damage was estimated at many thousands of dollars. Heavy rain of cloudburst proportions occurred at nearby Scottsdale, but damage was limited to flooded streets and cellars. The storm occurred during the passage of a cold front and an associated squall line which preceded the front.

Flooding occurred on most streams of the Commonwealth. The North Branch of the Susquehanna River went out of its banks at Towanda, Wilkes-Barre and Danville on the 23d-24th, due to moderate to heavy rainfall through the 16th-24th, following excessive snow melt during the second week of the month. Lowlands were flooded, and a highway bridge between Wyoming and Port Bowkley was damaged as a pier sagged due to the pressure of the flood waters. Hundreds of families were driven from their homes. It is estimated that several thousand anthracite mine workers were idled temporarily. At Harrisburg, flood stage was not reached, but some interruption was caused in local steel mill operations. High water on the Delaware River on the 22d and 23d caused very little damage or inconvenience to traffic. Considerable damage resulted from flooding on the Upper Allegheny River Basin on the 22d-25th. Three bridges were down near Cambridge Springs, Crawford County.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 86 stations was 39.9°, which is 2.1° above the 61-year normal for March. The highest monthly mean was 47.4° at Uniontown and the lowest was 31.8° at Montrose. Extremes ranged from a maximum of 90° at Phoenixville on the 22d to a minimum of −18° at Albion and Greenville on the 12th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 203 stations, was 3.71 inches, which is 0.20 inch above the 61-year normal for March. The greatest monthly amount was 7.49 inches at Youngsville, while the least was 1.54 inches at Butler. The greatest amount recorded in any 24 consecutive hours was 3.12 inches at Meadville on the 21-22d.

The average snowfall for the State was 5.0 inches, which is 2.7 inches below the 61-year normal. The greatest monthly snowfall was 19.5 inches at Montrose. The greatest fall for any observational day was 10.0 inches at Lawrenceville on the 11th.

(W. B. O., Philadelphia—6-28-48—1100)

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

VOL. LIII. APRIL 1948. No. 4.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25, D. C.

GENERAL SUMMARY.

This month was wet and warm. 1929 is the only year of record that had a greater average rainfall. Only 1920 and 1944 averaged more days with 0.01 inch or more of precipitation. There were five rather distinct wet periods, 1-2, 6-8, 11-15, 24-25, and 27-29. The 1st, 3d, and 5th spells produced the bulk of the rainfall total for the month. The average rainfall over the west portion of the Commonwealth was close to 6.5 inches while the east portion's average was just over 5.1 inches. The areas of heaviest rainfall were mainly in Westmoreland, Armstrong, and Cambria counties. Chester county in the east recorded the least rainfall. Tamaqua recorded measurable precipitation on 19 days of the month, while Burnt Cabins, Emporium, Stroudsburg and Claysville reported measurable precipitation on only 10 days of the month. Thunderstorms were reported over the Commonwealth on 16 days of the month, with hail occurring on the 8th, 11th, 20th, and 27th. Moderate hail fell for 10 to 15 minutes at Pittsburgh on the evening of the 27th.

The average temperature departure from normal for the east portion was an excess of near one degree, while the west portion's departure was in excess of nearly four degrees. As a consequence of this warmth there are only three other Aprils of record with less average snowfall. Highest temperatures were recorded generally on either the 20th or 26th, with few stations reporting other dates. The lowest temperatures during the month were recorded generally on one of the three dates — 4th, 10th, or 18th. The warmth of this April would normally have fostered forest fires, but the frequent rainy spells kept forest fire activity at a minimum.

At the beginning of the month, a slow moving disturbance over southeastern Canada with a trough southwestward along the Appalachians was drifting slowly eastward. As the trough moved across Pennsylvania it produced the general rainfall on the 1st and 2d of the month with many stations recording over an inch. During the night of the 2d, a vigorous mass of polar air moved into our area attended by strong northwest winds, snow flurries, and temperatures below freezing over much of the north and west portions of the State. On the 4th and 5th, afternoon temperatures rose to near 70 degrees with southwest winds aiding a brief increase in brush fires. From the 6th to the 8th Pennsylvania was in and out of the active weather zone with general showers. The night of the 8th saw the arrival of another cold air mass from the northwest with a return to below freezing temperatures in the mountains. The westward lobe of the Bermuda High Pressure area strengthened as pressures built up over the Atlantic Ocean on the 10th. This produced the blocking effect on the normal west to east movement of weather with a trough of Low Pressure extending from the upper St. Lawrence to the Lower Mississippi Valley. A series of small disturbances moved northeastward along this trough attended by very moist warm air which, when it was forced upward over the cool surface air, produced general moderate to heavy rainfall with several stations recording an inch or more a day for four consecutive days.

The heavy rainfall from the 11th to the 15th caused rises in rivers throughout the State. The crest at Pittsburgh was nearly 5 feet above flood stage, but was not high enough to cause great damage or loss of property, since in most cases there had been sufficient warning to permit protection of property. Crest stages on the main stem of the Susquehanna did not reach flood. Slight flooding occurred in the lower portions of the

(Continued on page 29.)

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 50.8°, which is 2.1° above the 61-year normal for April. The highest monthly mean was 58.4° at Uniontown and the lowest was 43.3° at Newburg. Extremes ranged from a maximum of 89° at Uniontown and Waynesburg on the 26th to a minimum of 15° at Kane on the 4th and 10th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 207 stations, was 5.55 inches, which is 2.10 inches above the 61-year normal for April. The greatest monthly amount was 10.10 inches at Carrolltown, while the least was 2.77 inches at Maple Glen. The greatest amount recorded in any 24 consecutive hours was 2.87 inches at Lycippus on the 27-28th.

The average snowfall for the State was 0.1 inch, which is 2.0 inches below the 61-year normal. The greatest monthly snowfall was 2.0 inches at Gordon. The greatest fall for any observational day was 2.0 inches at Gordon on the 28th.

[See page 32 for explanation of reference marks.]

(Continued from page 24.)

West Branch, and some flooding occurred in the headwaters of the Juniata River. In these cases, too, sufficient warning had been given to permit protection of property and no reports of flood damage were received. These rains poured so much water into the Sone's Pond near Jakersville that the concrete of the dam cracked under the pressure of the water and turned over on its side all the way across. The water washed out a bridge and left a channel 50 feet wide and 25 feet deep where it crossed the road. Uprooted trees and large quantities of debris were carried to the junction of the Loyalsock and the added amount of water raised the Loyalsock to such an extent that it flooded the World's End Park, running over the top of the concrete bridge which leads to the cabins and tenting area in the park.

The combination of the weakening of the Atlantic High and the broad southeastward advance of cool dry air on the 16th, ushered in the generally fair cool spell with moderating temperatures on the 19th, that rose to the upper seventies on the 20th. The fluctuating intensity of the cool High Pressure system over extreme eastern Canada resulted in shower periods for Pennsylvania on the 21st, 24th and 25th, and the 27th to 29th as the cool air from the northeast sought to dominate the surface weather and forced the moist warm air aloft.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.
[8] Data recorded at Altoona-Blair County Airport.
[9] Official Station designation is Allentown-Bethlehem Airport.

CLIMATOLOGICAL DATA

PENNSYLVANIA

MAY 1948

Volume LIII No. 5

NEW YORK CITY: 1948

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

PENNSYLVANIA MAY 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

he month was cool and wet, delaying agriculture and many outdoor activities. This coolness is irectly attributable to the frequent and persistent passages of cold fronts which brought out- reaks of cold air into Pennsylvania from central Canada. Sandwiched between these outbreaks of old air were surges of warm, moist air from the lower Mississippi Valley. The first break in he series of cold air outbreaks came with the strengthening of the Bermuda anticyclone which sent nseasonably warm air over the Gulf States and then up into Pennsylvania for the 11th and 12th. he 92° maximum temperature at Harrisburg on the 11th set a new record high for that date. This irculation was not sufficiently strong to overcome the normal coolness of southern Canada. The isparity between these two air masses was shown on the afternoon of the 10th when Erie's maximum emperature was only 61° in contrast to 81° at Pittsburgh, 83° at Williamsport and 88° at arrisburg and Reading.

he frontal zone between the warm, moist gulf air and the cool Canadian air vacillated across ennsylvania for 4 days, producing heavy rains on the eastern slopes of the Appalachians. For he 24 hours ending the morning of the 18th, East Waterford reported 3.77 inches and Bethlehem eported 2.72 inches.

reezing temperatures were reported periodically throughout the month over the State. Notable ong these were the mornings of the 1st and 2nd, the 8th and 9th, the 20th, 22nd and 24th. ow was reported at many stations in northern Pennsylvania on the 8th with some freezing rain nd freezing drizzle occurring in Clearfield County. The final cool spell on the 31st resulted n frost in the Wellsboro area.

hunderstorms were rather numerous this month, accompanied by hail on 7 days of the month. Many tations from the eastern slopes of the Appalachians to the Poconos reported hail on the 17th. A ropical storm moved from the Caribbean slowly northeastward to the west of Bermuda between the 3rd and 29th. This produced a blocking effect on what had been a persistent tendency for cool ir outbreaks to move into Pennsylvania from central Canada.

ainfall over the west portion of the State averaged about 1.00 inch less for the month than over he east portion. The area from Luzerne, Juniata and Adams Counties, east and south, averaged rom 2 to 4 inches more than any other sector of the State. Monthly totals of over 9 inches were ecorded at several stations along the arc from Bethlehem through Lancaster to East Waterford. A lash flood was reported at Central City, Somerset County, on the evening of the 28th.

TEMPERATURE

he average temperature for the State as deduced from the reports of 109 stations was 58.0°, hich is 1.6° below the 61-year normal for May. The highest monthly mean was 63.4° at hoenixville and Greensburg Filter Station, and the lowest was 51.7° at Kane. Extremes ranged rom a maximum of 95° at York on the 11th, to a minimum of 24° at Hawley on the 2nd.

PRECIPITATION

he average precipitation for the State, as deduced from the observations at 315 stations, was .24 inches, which is 1.21 inches above the 61-year normal for May. The greatest monthly amount as 10.67 inches at Pottstown, while the least was 2.58 inches at Coalport.

The following reference notes apply only to Table 7 - Daily River Stages

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a. Obstructed by rough ice.
b. Frozen but open at gage.
c. Upper surface of smooth ice.
d. Ice gorge above gage.
e. Ice gorge below gage.
f. Shore ice.
g. Floating ice.
h. Pool stage.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24 hours ending at time of observation. See the Station Index for observation time.

- \- No record.
- \+ And also on later dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- 6 Precipitation measured at 6-hourly intervals, no recording gage.
- a, b, c, through i. Number of days missing. a indicates one day missing, b indicates two days missing, etc.
- ss This entry in time of observation column in Station Index means sunset.
- k Total includes snow which accumulated in collar of the gage during previous period, and fell into gage for this measurement.
- r Station equipped with recording gage only. All amounts in Table 3 are from non-recording gages, except for stations with this reference.
- x Daily totals are for the 24 hours ending at 1:30 A.M., E.S.T., of the following day.
- z Hourly amounts from recording gage at the same site may be found in Table 4.
- T Trace, precipitation less than .005 inch, or snow depth less than .05 inch.

Data in Table 4 were formerly published in the Hydrologic Bulletins for North Atlantic District and Ohio River District. Amounts in this table are from recording gages. Traces are not shown.

CLIMATOLOGICAL DATA

PENNSYLVANIA

JUNE 1948

Volume LIII No. 6

NEW YORK CITY: 1948

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

PENNSYLVANIA - JUNE 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

This was the second consecutive cool and wet month. Rainfall for the first six months is now 3 inches in excess of average and the temperature, despite a fairly warm March and April, has averaged about 1.5° below normal each day.

The month opened under favorable conditions; a few showers were recorded and cool nights offset warm afternoons. In contrast to the favorable conditions experienced during the first week, the second week was cool, beginning with a near record minimum of 28° on the 6th at Phillipsburg, and more than normal precipitation. After the first 5 days there were thunderstorms reported some place in Pennsylvania on 21 of the following 25 days.

Heavy rains, winds and hail damaged property and crops to various degrees, and further interrupted their growth, hampered by wet fields and low temperatures. Phillipsburg reported a minimum of 32° on the 17th. Lightning resulted in a loss of $10,000 when a home was burned to the ground near Hawley on the 7th. Broken window panes and other minor property damage was reported in the south-central portion of the State on the 12th. Hail stones, 2 inches in diameter, fell in Bloserville.

Summer came abruptly by the 24th and was all the more pronounced due to the cool and wet period prevailing until the last week of the month. A thunder squall on the evening of the 24th at Philadelphia, resulted in an observed wind velocity of 46 miles per hour from the southwest and a short time later, the airport reported a velocity of 70 miles per hour with gusts to 90 miles per hour. Lightning again was active in the Hawley area, hail did crop and property damage in Chambersburg. The most notable storm occurred on the 27th when a tornado was reported to have caused $100,000 worth of damage in Hazelton.

At the close of the month, fields were weedy but crops were making good recovery, apparently not being affected materially by the comparatively severe weather of the month. The winter wheat yield will be above average; potatoes are in good condition under the ideal weather combination of cool nights and ample moisture; corn, oats and hay were not as well favored by the elements.

TEMPERATURE

The average temperature for the State as deduced from the reports of 114 stations was 66.7°, which is 1.4° below the 61-year normal for June. The highest monthly mean was 73.0° at Marcus Hook, and the lowest was 59.9° at Putneyville 2 SE. Extremes ranged from a maximum of 100° at Putneyville 2 SE on the 27th to a minimum of 28° at Kane 1 NW on the 6th.

PRECIPITATION

The average precipitation for the State, as deduced from the observations at 312 stations, was 5.39 inches, which is 1.41 inch above the 61-year normal for June. The greatest monthly amount was 8.38 inches at Indiana 2 SE, while the least was 2.20 inches at Ringtown 1 SW. The greatest amount recorded in any 24 consecutive hours was 4.07 inches at Indiana 2 SE on the 19th.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24 hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield
6	Precipitation measured at 6-hourly intervals, and at midnight. No recording gage.
a, b, c through i.	Number of days missing. a indicates one day missing, b indicates two days missing, etc.
ss	This entry in time of observation column in Station Index means sunset.
k	Total includes snow which accumulated in collar of the gage during previous period, and fell into gage for this measurement.
r	Station equipped with recording gage only. All amounts in Table 3 are from non-recording gages, except for stations with this reference.
x	Daily totals are for the 24 hours ending at 1:30 A.M., E.S.T., of the following day.
z	Hourly amounts from recording gage at the same site may be found in Table 4.
T	Trace, amount too small to measure.

Data in Table 4 were formerly published in the Hydrologic Bulletin for North Atlantic District. Amounts in this table are from recording gages. Traces are not shown.

CLIMATOLOGICAL DATA

PENNSYLVANIA

JULY 1948

Volume LIII No. 7

THE LIBRARY OF THE
UNIVERSITY OF ILLINOIS

NEW YORK CITY: 1948

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nation-wide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

PENNSYLVANIA - JULY 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

The second vacation month was generally on good behavior. Most nights were comfortably cool for sleeping and very few days saw the mercury rising into the 90's. Precipitation was near normal despite a number of areas in the west and north having monthly totals to 6.00 inches. The bulk of this precipitation fell in two periods; that of the 13-14 and the 21-24.

The first 6 days of the month the State was being criss-crossed by a series of weak pressure ridges and troughs. Each alternation caused another outbreak of showers or thunderstorms in some section of the State. Damage reports were numerous and on the 5th a consolidated school building near Wilkes-Barre was struck by lightning and burned to the ground at a loss of a quarter million dollars. The following day, Philadelphia was hit by storm winds and heavy hail. The 7th ushered in a cool spell that caused temperatures to drop to near record minima on the following days. A minimum of 37° was reported from Phillipsburg while Harrisburg reported a record low maximum of 71°.

The second decade of the month opened with more seasonable warmth and humidity but was replaced on the 13th by a second push of cool Canadian air that dominated the State until the 17th. For a week an east-west frontal system with minor waves, (low pressure systems), moving along the front, produced unsettled weather and locally severe storms. A man was killed near Monroeton on the 19th by lightning during one of these storms. A series of them on the 22-24, produced heavy amounts of rainfall in most parts of the State. A large Ohio Valley high pressure system caused a displacement of the frontal system and produced generally fair weather for several days.

The first 20 days of the month favored harvesting of hay and winter grains and the cultivation of row crops. In fact, some areas reported that the soil became too dry for the best growth of crops. Wheat yields were, however, disappointingly low; some hay was damaged but most stored in good shape and quality, and good oat yields were reported as harvesting progressed towards the close of the month.

TEMPERATURE

The average temperature for the State as deduced from the reports of 114 stations was 72.2°, which is 0.1° below the 61-year normal for July. The highest monthly mean was 79.1° at Marcus Hook and the lowest was 65.0° at Tunkhannock. Extremes ranged from a maximum of 97° at Holtwood on the 1st and Columbia on the 5th, to a minimum of 38° at Kane 1 NW on the 8th.

PRECIPITATION

The average precipitation for the State, as deduced from the observations at 308 stations, was 4.04 inches, which is .27 inch below the 61-year normal for July. The greatest monthly amount was 8.27 inches at Avoca Wilkes-Barre Airport, while the least was .50 inch at Tellersville.

following reference notes apply only to Table 7 - Daily River Stages:

dings are made at approximately 7 A.M. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - ncipal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with windshield.
S	No recording gage, precipitation is measured at 6-hourly intervals.
a, b, c, through i	Number of days missing. a indicates one day missing, b indicates two days missing, etc.
ss	This entry in time of observation column in Station Index means sunset.
r	Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
x	Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
z	Hourly amounts from recording gage at the same site may be found in Table 4.
T	Trace, an amount too small to measure.

Data in Table 4 were formerly published in the Hydrologic Bulletins for the North Atlantic District and the Ohio River District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

PENNSYLVANIA AUGUST 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

August was a month of sharp contrast. The first three weeks were unusually cool and the month would have been notable for its low mean temperature had the pattern persisted another few days. However, there was a major change in the pressure systems affecting eastern United States that caused the last decade to be one of the hottest in several years. Most of the temperature deficiency accumulated in the first three weeks was wiped out in the latter period of blistering heat. The excess of precipitation which had accumulated in the first half of the month, was wiped out in most areas by the dry weather associated with the heat.

During those first twenty odd days of the month, the daily maximum temperature rarely reached the mid-eighties in any part of the State. High pressure, which dominated the weather map, was reenforced by polar air to produce the coolest period of the month in the very heart of summer - from the 5th to 10th. Here and there record low maximum temperatures were recorded; Pittsburgh had a daytime maximum of only 63° on the 5th, just 2° above the all-time record. Nighttime minima were mainly in the low fifties on the 8th and 10th, with mountain stations reporting values in the low forties, and Phillipsburg and Kane - the low for the month - 34°.

The hot period was fully underway by the 24th and from that date it was a general rule to have ninety degree temperatures reported on the next 5 to 7 days. The counties in the southern half of the State experienced 1 to 3 days with the thermometer exceeding the century mark, although Bakerstown, Eagles Mere and Mount Pocono only reported 2 days with 90° or more during the month. The last of August is rather late for so high temperatures, but their occurrence is by no means unknown. Many earlier records show more days with high temperatures, but the suddenness and duration of the heat, which was accompanied by moderately high humidity, was of more interest than its arrival so late in the season.

Practically all of the precipitation of the month fell between the 3rd and 22nd on about nine dates. Heavy showers on the 3rd and 5th established reasonably large accumulation in excess of normal, but these were not substantial enough to hold the gains against the dry weather that started to get a foothold about the 15th, and the month's total averaged a half inch below normal. Southeastern and west-central counties generally fared better than elsewhere; Conshohocken reported 15 days with measurable rain and Palmerton four days with one inch or more. Adequate rainfall in the previous months helped carry crops through the dry period, although some soils were too dry for corn. Cobblers exceeded the 400 bushel mark in the southeast, but on the other hand, the early subnormal temperatures favored the spread of blight.

The Summer averaged about one degree below and precipitation one-half inch below normal.

TEMPERATURE

The average temperature for the State as deducted from reports of 118 stations was 70.1° which is 0.2° below the 61-year normal for August. The highest monthly mean was 77.9° at Marcus Hook, and the lowest 62.5° at Kane. Extremes ranged from a maximum of 106° at Marcus Hook on the 27th, to a minimum of 34° at Phillipsburg on the 8th and Kane on the 10th.

PRECIPITATION

The average precipitation for the State, as deduced from observations at 319 stations, was 3.62", which is 0.52" below the 61-year normal for August. The greatest monthly amount was 7.18" at Chadds Ford, while the least was 1.53" at Lewistown. The greatest amount recorded in any 24 consecutive hours was 4.44 inches at Claysville on the 5th.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

- \- No record.
- \+ And also on later dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with windshield.
- 6 No recording gage, precipitation is measured at 6-hourly intervals.
- a, b, c, through i Number of days missing. a indicates one day missing, b indicates two days missing, etc.
- ss This entry in time of observation column in Station Index means sunset.
- r Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
- x Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
- z Hourly amounts from recording gage at the same site may be found in Table 4.
- T Trace, an amount too small to measure.

Data in Table 4 were formerly published in the Hydrologic Bulletins for North Atlantic District and Ohio River District. Amounts in this table are from recording gages. Traces are not shown.

UNIVERSITY OF ILLINOIS

SEPTEMBER 1948

Volume LIII No. 9

WASHINGTON: 1948

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

PENNSYLVANIA - SEPTEMBER 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

This first month of meteorological autumn is characteristically dry, seemingly balmy and sunny with a few hot days in the first week and some frosty days in the latter half of the month; thunderstorms are normally recorded at a large number of stations and the "equinoctial" rains are a more or less regular occurrence about the first day of Fall. However, this general description did not fit the weather for September, 1948 as it was mild, unusually dry and there was a little less sunshine than normal.

The first day of the month was cool with scattered light frost in western counties, but the weather moderated thereafter through the second decade, with a small portion of the stations reporting 90° maxima on the 13th or 14th. A large high pressure system moving out of Canada on the 21st, terminated the warm weather. Frosty mornings were prevalent in the central areas beginning on the 22nd. The month's low of 25° at Philipsburg was 8° warmer than the all-time September minimum recorded there a year previously.

Only six other Septembers have had less precipitation recorded. The greatest deficiencies, 3.00 inches or more, were in Wayne, Pike, Monroe, Luzerne, Sullivan and Columbia Counties, and locally in Bradford County. Only in portions of Chester, Crawford and Washington Counties did a few stations report excesses of precipitation. Water supply became low in central counties and in the northeastern dairy area some hauling of water was necessary during the first three weeks of September. Some wells went dry in central localities the third and fourth weeks of the month. Thunderstorms in the vicinity of Bloomsburg, Pa. caused $20,000 damage when lightning destroyed 10 farm animals and a barn, and winds uprooted 50-foot high trees that were over 1 foot in diameter.

Extended dry weather limited size of grapes and winter apples and slowed up the sowing of wheat and rye; corn, potatoes and oats, either were benefited or held their own because of the dry weather during the month. Buckwheat, late cabbage and soybean yields were disappointing. Tobacco generally weathered unseasonable dry spell.

TEMPERATURE

The average temperature for the State as deduced from the reports of 112 stations was 63.8°, which is 0.4° below the 61-year normal for September. The highest monthly mean was 70.9° at Marcus Hook and the lowest was 56.8° at Hawley (Wallenpaupack Dam). Extremes ranged from a maximum of 95° at Phoenixville on the 13th and Lewistown on the 14th, to a minimum of 25° at Philipsburg on the 22nd.

PRECIPITATION

The average precipitation for the State, computed from the observations of 114 stations was 1.62", which is 1.81" below the 61-year normal for September. The greatest monthly amount was 4.95" at West Chester, while the least was 0.17" at Ingmans Ferry. The greatest 24-hour precipitation was 3.02" at Jamestown on the 20th.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages-Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

REFERENCE NOTES

he four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers ithin a state.

tations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

elayed data and corrections will be carried only in the June and December issues of this bulletin.

ata in Tables 3, 5 and 6 are for the 24-hours ending at time of observation.

- No record.
→ Amt also on later dates.
* Amount included in following measurement, time distribution unknown.
// Gage is equipped with windshield.
6 No recording gage, precipitation is measured at 6-hourly intervals.
a, b, c, through i Number of days missing. a indicates one day missing, b indicates two days missing, etc.
ss This entry in time of observation column in Station Index means sunset.
r Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
x Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
z Hourly amounts from recording gage at the same site may be found in Table 4.
T Trace, an amount too small to measure.

Data in Table 4 were formerly published in the Hydrologic Bulletins for North Atlantic District and Ohio River District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

PENNSYLVANIA - OCTOBER 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

The pleasant harvest month was more cloudy and cooler than usual. The sharp contrast between the customary October an that just closed, was emphasized by the rainy period that lasted through the first three weeks. Total sunshine for t month at Pittsburgh was only 18% of possible compared to the normal of 55%. The third decade had typical Indian Summ weather that enabled farmers to complete many Fall chores.

Although the precipitation average was just under normal, the frequent and ample amounts received before the 20th re- lieved the growing, critical need for rainfall. The heaviest precipitation occurred on th 17th as a storm developed a cold front ushering in a strong and cold high pressure system. Twenty-four hour precipitation amounts were under 2.00 inches but Sunday travelers in the North-Central Counties were caught in a sudden snowstorm. Traces of snow were reported over the mountains as far south as Adams County. Only in Tioga and Bradford Counties, did amounts reach 4 to inches in depth. Earlier snow storms have been reported but this occurrence was unusual.

The growing season ended with killing frost in many northern and mountain areas at various dates prior to the 19th, b on that date the freezing temperature following the snowstorm, ended vegetal growth generally over the State. The co harvest was excellent this year and the potato yield was of record proportions.

A subsiding (settling) layer of air existed over western Pennsylvania and West Virginia on the 26th, at about 3000 fe elevation. This layer subsequently dropped very close to the ground, creating a gray, oppressive fog blanket that ac cumulated industrial gases and smoke, requiring illumination inside and out at midday. Twenty aged inhabitants of th industrial town of Donora died of respiratory or cardiac diseases and some 400 others were stricken during the period of the 26th to 31st. These were attributed to the toxic action of the captive fumes. Official conclusions as to the actual cause of the deaths and sickness have not been reached. A similar instance of this nature was reported for Belgium, when on December 5, 1930, 60 persons died in the Meuse River valley near Liege.

TEMPERATURE

The average temperature for the State as deduced from the reports of 115 stations was 50.2°, which is 2.4° below the 61-year normal for October. The highest monthly mean was 58.4° at Marcus Hook and the lowest was 44.1° at Kane. Ex- tremes ranged from a maximum of 85° at Phoenixville on the 1st to a minimum of 14° at Burnt Cabins on the 3rd and Hawley, 1 S Wallenpaupack Dam on the 22nd.

PRECIPITATION

The average precipitation for the State, as deduced from the observations at 117 stations, was 3.08 inches, which is 0.15 inch below the 61-year normal for October. The greatest monthly amount was 5.99 inches at South Mountain, while the least was 0.96 inch at Allentown-Easton Airport. The greatest amount recorded in any 24 consecutive hours was 2. inches at South Mountain on the 6th.

The average snowfall for the State was 0.2 inch, which is also the 61-year normal. The greatest monthly snowfall was 5.0 inches at Monroeton. The greatest fall for any observational day was 5.0 inches at Monroeton on the 17th and 18t

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from the Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages---mostly of the recording type which pr duce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Depar ment of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording gages, has been maintained by the Weather Bureau through wor ing funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western State

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offi private agencies, and individuals as listed in the Station Index.

NOTICE TO ALL RECIPIENTS OF PENNSYLVANIA CLIMATOLOGICAL DATA

The August issue of the Climatological Data Bulletin, Pennsylvania Section, has not yet been printed under the new record-processing program at Albany, N. Y. It is expected to be issued in the very near future. The November and subsequent issues will be forthcoming in a regular manner.

PENNSYLVANIA - OCTOBER 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

The pleasant harvest month was more cloudy and cooler than usual. The sharp contrast between the customary October an that just closed, was emphasized by the rainy period that lasted through the first three weeks. Total sunshine for t month at Pittsburgh was only 18% of possible compared to the normal of 55%. The third decade had typical Indian Sum weather that enabled farmers to complete many Fall chores.

Although the precipitation average was just under normal, the frequent and ample amounts received before the 20th re- lieved the growing, critical need for rainfall. The heaviest precipitation occurred on th 17th as a storm developed a cold front ushering in a strong and cold high pressure system. Twenty-four hour precipitation amounts were under 2.00 inches but Sunday travelers in the North-Central Counties were caught in a sudden snowstorm. Traces of snow wer reported over the mountains as far south as Adams County. Only in Tioga and Bradford Counties, did amounts reach 4 to inches in depth. Earlier snow storms have been reported but this occurrence was unusual.

Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western State

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offi private agencies, and individuals as listed in the Station Index.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

- \- No record.
- , And also on later dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with windshield.
- 6 No recording gage, precipitation is measured at 6-hourly intervals.
- a, b, c, through i Number of days missing. a indicates one day missing, b indicates two days missing, etc.
- ss This entry in time of observation column in Station Index means sunset.
- r Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
- x Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
- z Hourly amounts from recording gage at the same site may be found in Table 4.
- T Trace, an amount too small to measure.

Data in Table 4 were formerly published in the Hydrologic Bulletins for North Atlantic District and Ohio River District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

PENNSYLVANIA - NOVEMBER 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

November provided a warm wet introduction to approaching winter. The month averaged nearly 5 degrees above normal and tied with 1896 for the fifth warmest of record. Precipitation averaged 1.64 inches above normal, making it the tenth wettest of record. A snowstorm on the 28th and 29th deposited up to 9 inches of snow in the mountains and proved that winter was approaching.

Temperatures rose to the seventies on one or more days during the month, except for a dozen or so stations in the mountain sections of the state. A heat wave on the 5th and 6th sent temperatures into the mid-eighties in the extreme southwestern counties. The entire state reported above normal temperatures for November, although Everett barely made it with a +0.2 departure. Temperatures averaged 7 degrees or more above normal from Luzerne to Susquehanna Counties and near Lake Erie. Five stations, Erie, Pittsburgh, Philadelphia, Marcus Hook and Holtwood reported no temperatures below freezing. This is the first month since April in which temperatures for the state averaged above normal and only the third month this year. Above normal temperatures for 5 consecutive weeks are reflected in below normal coal consumption which has resulted in reduced production at some mines.

Pittsburgh recorded a new record maximum temperature for the month when the Airport station reported 80 degrees on the 5th. The maximum of 77 degrees at Harrisburg on the 6th equalled the November record maximum. Philadelphia registered a new record maximum of 78 degrees on the 6th. This was the second warmest November of record at Philadelphia, and Pittsburgh reports that it is the warmest of record at the Airport station there.

This is the first month since June which has recorded an excess of precipitation for the state and only the fourth so far this year. Corry and Warren marred the record of having every station show above normal precipitation totals. Nearly the whole Appalachian and Pocono Mountain areas averaged over 2.00 inches above normal, while Gordon and Gettysburg reported excesses of 3.95 and 4.02 inches respectively. Rains up to 4 times normal during the first week replenished ground water supplies with some moderate rises shown on rivers. A touch of winter with falling temperatures and general snow on the night of the 28th left 3 to 9 inches of snow in central counties, and 1 to 6 inches in the northeastern counties by the night of the 29th when snow ended. Very little snow was recorded in the counties southeast of the mountains and in the western tier of counties. The heaviest snowfall for the month occurred in the area from Juniata to Cambria and Clearfield Counties.

The main features of the weather maps during the month were the repeated development of high pressure off the Atlantic coast and the fact that many storm centers moved north-northeastward to the west of Pennsylvania. Both of these situations made it very favorable for southerly winds to maintain warm temperatures in Pennsylvania and to bring much moisture laden air against the Appalachians.

TEMPERATURE

The average temperature for the State as deduced from the reports of 75 stations was 46.0, which is 4.6° above the 61-year normal for November. The highest monthly mean was 54.3° at Philadelphia Franklin Institute and the lowest was 38.9° at Newburg, 3 W. Extremes ranged from a maximum of 85° at Uniontown on the 5th to a minimum of 13° at Everett on the 30th.

PRECIPITATION

The average precipitation for the State, as deduced from the observations at 306 stations, was 4.56 inches, which is 1.64 inches above the 61-year normal for November. The greatest monthly amount was 7.67 inches at Meadow Run Ponds, while the least was 2.42 inches at Beaver Falls. The greatest amount recorded in any 24 consecutive hours was 2.54 inches at Williamsport, 4 SE on the 20th.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin serie contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. Th Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

REFERENCE NOTES

e four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers thin a state.

ations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

layed data and corrections will be carried only in the June and December issues of this bulletin.

ta in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

- No record.
+ And also on later dates.
* Amount included in following measurement, time distribution unknown.
// Gage is equipped with windshield.
6 No recording gage, precipitation is measured at 6-hourly intervals.
a, b, c, through i Number of days missing. a indicates one day missing, b indicates two days missing, etc.
m One or more days of record missing; see Table 5 for detailed daily record.
ss This entry in time of observation column in Station Index means sunset.
r Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
x Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
z Hourly amounts from recording gage at the same site may be found in Table 4.
T Trace, an amount too small to measure.

ta in Table 4 were formerly published in the Hydrologic Bulletins for the North Atlantic District and Ohio River District. Amounts in this table are from cording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

PENNSYLVANIA - DECEMBER 1948

L. J. Conover, Section Director - Harrisburg

GENERAL SUMMARY

The first month of winter started off on a mild and wet basis. All reporting stations showed a fairly even distribution of above normal temperatures, most of which were from one to three degrees above normal. It was the ninth wettest December of record and the wettest since 1942. It was the fifth month this year with above normal precipitation. In the extreme northwestern counties of Venango, Warren, Crawford and Erie, precipitation was 0.50 to 1.80 inches below normal although nearly all the areas ranged above normal. Indiana County showed individuality in its precipitation with the reporting station at Indiana showing an excess of nearly one inch while Blairsville reported a deficiency of a half inch. Precipitation over the eastern portion of the State averaged 1.75 inches above normal compared to the western portion's 0.55 inch average above normal.

The first and second decades were mild and recorded the highest temperatures of the month. The northern counties recorded mild temperatures in the fifties during the first week and the southern counties recorded temperatures in the middle and upper sixties in the second week of the month. By the end of the third week, the spell of above normal temperatures had run the total to eight consecutive weeks. The fourth week was well below normal and due to the sudden change, seemed even more severe. With few exceptions, the lowest temperatures for the month were recorded on the 26th and 27th when temperatures below zero were recorded over nearly two-thirds of the State.

While snowfall was not exceptionally heavy, most areas received at least one good snow during the month. The snowstorm of the 19th produced depths of one to three inches over the extreme northwest portion and six to ten inches in the mountains and the eastern portion of the State. The areas of total monthly snowfall of ten or more inches for the month were from Perry to Bucks Counties and northward to Montrose and Wayne Counties, then along the northern border of the State and locally on the extreme western and eastern ridges of the Appalachians. Least snowfall occurred from Jefferson to Mercer and Beaver Counties.

The week ending the 20th saw precipitation amounts over the State averaged more than twice normal. Confluence, Pa. reported over four inches. As a result there was brief flooding on the Monongahela on the 16th. As a portent of winter weather to come, the glaze storm on the 15th and 16th over the central and east portions of the State seriously hampered traffic and caused wire trouble. The general pattern of weather movement the first half of December was from southwest to northeast. The third week in the month saw a change to from west to east, thus permitting cold air to approach Pennsylvania on a much more direct route from central and western Canada.

The snowstorm of the 19th ushered in the cold weather for the days before Christmas. This was intensified by a fresh outbreak of cold air on the 25th and 26th which brought below zero temperatures to many sections of the State. Many portions of the State had some snow cover still remaining on the ground at Christmas from the storm of the 19th. The Holiday week brought a return to rather high minimum temperatures, two to three inches of rain over the east portion of the State and three to eight inches of snow over the mountains. Rises in rivers during this week cleared out most of the ice. Flooding up to one to three feet above flood stage occurred in the Delaware Basin during the last days of the month, some minor flooding occurred on a few tributaries of the Susquehanna, but there was no flooding this time in the Allegheny or Monongahela basins.

TEMPERATURE

The average temperature for the State as deduced from the reports of 118 stations was 32.6°, which is 1.4° above the 61-year normal for December. The highest monthly mean was 40.9° at Philadelphia Franklin Institute and the lowest was 27.3° at Eagles Mere. Extremes ranged from a maximum of 69° at Huntingdon on the 14th to a minimum of -16° at Kane on the 26th.

PRECIPITATION

The average precipitation for the State, as deduced from the observations at 112 stations, was 4.25 inches, which is 1.18 inches above the 61-year normal for December. The greatest monthly amount was 7.17 inches at George School, while the least was 1.79 inches at Warren. The greatest amount recorded in any 24 consecutive hours was 2.52 inches at Eagles Mere and George School on the 30th.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

ERRATA

July, 1948 - Minimum on 11th for Pittsburgh 7 SE WB Airport should be 66; minimum on 12th should be 69.

August, 1948 - Minimum on 9th for Pittsburgh 7 SE WB Airport should be 58; maximum on 15th, 78; minimum on 15th, 58; maximum on 17th, 74; minimum on 17th, 62; mean maximum, 81.9.

September, 1948 - Minimum on 10th for Pittsburgh 7 SE WB Airport should be 60; minimum on 13th, 63; mean minimum, 56.3.

ERRATA FOR TABLE 3

May, 1948 - Monthly total for Jamestown 2 NW Dam should be 3.59.

May, 1948 - Delete .10 on May 1 for Towanda. Monthly total should be 5.78.

October, 1948 - Amount on October 17 for Morgantown Lock 10 should be .01; monthly total, 2.32.

ERRATA FOR TABLE 4

November 1948 - Data on 17th for Jackson Summit should be shown in the A.M. columns.

November 1948 - Data on 27th for Lancaster 2 NE Filter Plant should be shown in the A.M. columns.

November 1948 - Data for Meadville for the 23rd should be as follows:

6 A.M., .01; 7 A.M., .01; 8 A.M., .01; 10 A.M., .01; Total, .04.

following reference notes apply only to Table 7 - Daily River Stages:

dings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - ncipal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

ly River Stages will not be published in Climatological Data in the future. They will be published annually in the publication "Daily River Stages - Principal Rivers of the United States".

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

- \- No record.
- \+ And also on later dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with windshield.
- 6 No recording gage, precipitation is measured at 6-hourly intervals.
- m One or more days of record missing; see Table 5 for detailed daily record.
- ss This entry in time of observation column in Station Index means sunset.
- r Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
- x Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
- z Hourly amounts from recording gage at the same site may be found in Table 4.
- T Trace, an amount too small to measure.

Data in Table 4 were formerly published in the Hydrologic Bulletins for the North Atlantic District and Ohio River District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

ANNUAL SUMMARY 1948

Volume LIII No. 13

ALBANY: 1949

PENNSYLVANIA - 1948

L. F. Conover, Section Director - Harrisburg

GENERAL SUMMARY

JANUARY - January was the 6th coldest and 5th snowiest of record. It was 14° per day colder than January 1947. The cold aggravated a bad fuel shortage and in many localities, the use of gas for industrial purposes had to be cut off. Fuel oil was also in very short supply. Precipitation was very frequent, although slightly below normal, but snowfall was about double the normal owing to the cold. New Year's Day recorded rain, sleet and freezing rain, causing slippery roads that resulted in many traffic accidents.

FEBRUARY - Normal temperatures, a surplus of sunshine and a deficiency in precipitation were the key notes of the month. January's cold spell continued during the first 11 days of February after which rapid warming took place, thawing most of the snow cover and rotting the ice in the rivers. Ice generally moved out of the rivers without untoward incident from about the 15th to the 17th.

MARCH - Temperatures averaged well below normal until about the 14th and rose above normal the remainder of the month which was fairly mild for March. The premature warm spell reached a climax on the 21st, Palm Sunday. However, Easter on the 28th, was marred by cold blustery weather with light snow in nearly all sections. A tornado struck Mount Pleasant in Westmoreland County about 7:30 P.M. on the 19th. Three children sustained minor injuries due mostly to flying glass. Many thousands of dollars of property damage resulted from this storm. The north branch of the Susquehanna River went out of its banks at Towanda, Wilkes-Barre, and Danville on the 23rd and 24th. High water on the Delaware River on the 22nd and 23rd caused very little damage or inconvenience to traffic. Considerable damage resulted from flooding on the Upper Allegheny River Basin from the 22nd to the 25th.

APRIL - This month was wet and warm. 1929 is the only year of record that had a greater average rainfall. There are only 3 other Aprils of record with less average snowfall. The heavy rainfall from the 11th to the 15th caused rises in rivers throughout the State. The crest at Pittsburgh was nearly 5 feet above flood stage but was not high enough to cause great damage or loss of property since in most cases there had been sufficient warning to permit protection of property. Crest stages on the main stream of the Susquehanna did not reach flood. Slight flooding occurred on the lower portions of the west branch and some flooding occurred in the headwaters of the Juniata River.

MAY - The month was cool and wet delaying agriculture and many outdoor activities. Freezing temperatures were reported periodically throughout the month over the state; the final cool spell on the 31st resulted in frost in the Wellsboro area.

JUNE - This was the second consecutive cool and wet month. After the first 5 days, there were thunderstorms reported some place in Pennsylvania on 21 of the following 25 days. Hail stones, 2 inches in diameter, fell in Bloserville on the 12th. Summer came abruptly by the 24th, on which date Philadelphia Airport reported a velocity of 70 miles per hour, with gusts to 90 miles per hour during a thunder squall. A tornado was reported to have caused $100,000 worth of damage in Hazelton on the 27th. Rainfall for the first 6 months is now 3 inches in excess of average and the temperature has averaged 1.5° per day below normal.

JULY - Most nights were comfortably cool and very few days saw the mercury rising into the 90's. Temperatures averaged normal, while precipitation averaged slightly below normal. Damage reports from thunderstorms were numerous, the outstanding being the Consolidated School Building near Wilkes-Barre, which was struck by lightning and burned to the ground at a loss of a quarter million dollars.

AUGUST - The first 3 weeks were unusually cool while the last decade of the month was one of the hottest in several years. Counties in the southern half of the State experienced 1 to 3 days with the thermometer exceeding 100°.

SEPTEMBER - A mild and unusually dry month with a little less sunshine than normal. Frosty mornings were prevalent in the central areas beginning on the 22nd. The month's low of 25° at Philipsburg was 8° warmer than the all-time September minimum recorded there a year previously. Only 6 other Septembers have had less precipitation recorded. The greatest deficiencies, 3.00 inches or more, were in Wayne, Pike, Monroe, Luzerne, Sullivan and Columbia Counties, and localities in Bradford County. Water supply became low in central counties and in the northeastern daily area, some hauling of water was necessary during the first 3 weeks in September. Some wells went dry in central localities the last half of the month.

OCTOBER - This was more cloudy and cooler than usual with a rainy period that lasted through the first 3 weeks. The 3rd decade had typical summer weather that enabled farmers to complete many fall chores. Sunday travelers in the north-central counties were caught in the sudden snow storm on the 17th when Tioga and Bradford Counties reported 4 to 5 inches of snow. Earlier snow storms have been reported but this occurrence was unusual. Freezing temperatures on the 19th, following the snow storm, ended vegetal growth generally over the State. Twenty aged inhabitants of the industrial town of Donora, died of respiratory or cardiac diseases and some 400 others were stricken during the period of the 26th to the 31st, when an oppressive fog blanket accumulated in that vicinity.

NOVEMBER - November was a warm, wet month with temperatures averaging 4.6° above normal and precipitation 1.6 inches above normal. Temperatures and precipitation averaged above normal at all stations during the month, except Corry and Warren where slight deficiencies were recorded. This is the first month since June which has had an excess of precipitation.

DECEMBER - This was the second consecutive month of above normal values for the State following 4 months of below normal values. The Monongahela flooded briefly on the 16th when precipitation for the week ending December 20th averaged over twice normal in that watershed. A glaze storm in the central and eastern portions of the State on the 15th and 16th hampered traffic and caused some wire trouble. Christmas week marked the end of 8 consecutive weeks of above normal temperatures. The snow storm on the 19th produced depths up to 10 inches in the mountains and eastern portion of the State with some snow continuing on the ground for Christmas.

- - - - -

TEMPERATURE

Based on the records from 93 temperature stations, the average annual mean temperature for the State was 50.2°, which is the mean for the past 61 years. The highest annual mean temperature was 64.4° at Newell; the lowest was 44.0° at Kane. The highest temperature reported was 106° at Marcus Hook on August 27th; the lowest was -31° at Kane on January 31st. The annual range for Pennsylvania was 137 degrees; the greatest local annual range was 126°+ at Lawrenceville; the least local annual range was 94° at Erie. Maxima of 100° were reported on only 5 days, viz: June 27th, August 26th, 27th, 28th, 29th.

PRECIPITATION

Based on the records from 203 precipitation stations, the average annual precipitation for the State was 46.31 inches, which is 4.25 inches above the mean for the past 61 years. The average annual snowfall for the State was 46.3 inches which is 4.3 inches above the mean for the past 60 years. The greatest annual precipitation was 67.09 inches at Kregar; the least annual amount was 36.64 inches at Lawrenceville. The greatest local monthly amount was 10.67 inches at Pottstown in May; the least local monthly amount was 0.17 inches at Dingman's Ferry in September. The greatest amount in any 24-hour observational day was 4.44 inches at Claysville on August 5th. The average number of days with .01 inch or more of precipitation was 141 which is 14 above the mean for the past 61 years.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375.000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

The Department of Forests and Waters of the Commonwealth of Pennsylvania h made available for inclusion in this bulletin the records from approximate 90 recording precipitation stations.

Previous to the introduction of this bulletin series, data from Hydroclima Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire Unit States, but since the Network was established to meet the internal require ments of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where re erence copies of the Hydrologic Bulletin Series are available for inspecti may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, an individuals as listed in the Station Index.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in F, precipitation and evaporation in inches and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Delayed data and corrections will be carried only in the June and December issues of the Climatological Data.

\- No record.
\+ Also later dates or months.
M 1 to 10 days' record missing; see monthly Climatological Data for detailed daily record.

The subscription price for this bulletin is 15 cents per copy or $1.50 a year. (Yearly subscription includes annual summary). Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.
